

It's a great feeling knowing that even in times of PANDEMIC, there is what we call a silver lining that gives us a glimpse of a little life, a little light, a little hope, a little chance to help us get through it. Our lives and the education system have been put into test. Resiliency is a word. But same webinar series is what I've been saying a while ago, a glimpse of light to make us hopeful. That everything will be alright. I've been in various seminars during this pandemic and SEAMEO webinar series really put me in a good perspective. All their learnings are real and practical. I've been looking forward for this webinar series with a theme: Teaching technology and agriculture in the new normal because I've been looking for new ways, new avenues of learning for my entrepreneurship students. I have a feeling that gardening/agriculture or survival gardening would be very helpful to my students. Good thing I came across with these themes where I learned mushroom production and the different ways to make an organic fertilizer. We need to teach our students lifelong skills. Which are practical that will help them in everyday living and will aid them in their education. We have a saying if we teach our students to fish or to plant we help in building our nation...the whole Asia. I'm proud to say that I'm recommending your webinars to my co teachers and my students. We learned a lot from your speakers and lecturers whom I could say were very expert in their various fields. Thank you SEAMEO. More power.
